CodingCards

CodingCards is a set of practices that transforms Poker cards into teaching materials for learning basic coding concepts. It was developed when I was teaching programming at Shenzhen Longgang Technical-vocational School in 2018. Many students at this school are from rural-urban migrant families and have low self-esteem due to constant failure in their studies. Computer interfaces are also foreign to some as they rarely have the opportunity to interact with them. Therefore, for them, learning to code is more than just a technical challenge. They also need to break through motivational and psy-

Community Network Project

I initiated the Community Network Project in 2017 to empirically study how my peers in the Minerva Class 2019 has been connected and disconnected over time. What triggered me to start such project is a few debates within my class cohort regarding whether forming small cliques should be allowed as people feel for the need of close friendships but also do not want to exacerbate the isolations. Some doubt that friend groups were crystallized after the Sophomore year and thus were difficult to open up again. Without empirical evidence, people often resolved to use moralizing

History Podcast

The History Podcast named "Human Biases Behind Algorithms" was created as the final project for my Global History class in 2017. In the Podcast, I creatively juxtaposed computerized algorithms with a British recipe called the Old Eel Pie in the 17th century, and Fordism, the management and production practices by the car company Ford, in the early 20th century. By creating this history podcast, I want to expand people's conception of algorithms as more than just indifferent and external computer objects. My goal is to produce historically accurate stories that immerse people in the

Global Slum Immersion

Global Slum Immersion is a series of efforts to document, historicize, and compare slums (or places that used to be slums but were redeveloped) worldwide. As I study and live in San Francisco, Berlin, Buenos Aires, Seoul, Hong Kong, Shenzhen, and London with my school over the past four years, I have been taking notes on the under-resourced and redeveloped neighborhoods. My goal is to contextualize the local sites I visited within a broader social, political, and cultural history background and connected them a global discourse of slums. Furthermore, I would like to share my knowl-

CodingCards

CodingCards is a set of practices that transforms Poker cards into teaching materials for learning basic coding concepts. It was developed when I was teaching programming at Shenzhen Longgang Technical-vocational School in 2018. Many students at this school are from rural-urban migrant families and have low self-esteem due to constant failure in their studies. Computer interfaces are also foreign to some as they rarely have the opportunity to interact with them. Therefore, for them, learning to code is more than just a technical challenge. They also need to break through motivational and psychological barriers.

CodingCards is designed to provide a playful, accessible, scalable solution for students to be familiar with computational thinking using only Poker cards, sticky notes, and pens. One card presents a variable that can be initialized as numbers, strings (with sticky notes), boolean (jokers), while suits indicate lists. Instead of thinking in abstract terms, students are asked to use these tools to perform simple coding tasks. For example, to “code” a Rock Paper Scissor game, students need to decide what cards to use and then verbalize the procedures when manipulating cards in their hands. Through the CodingCards, I hope students can not only learn coding concepts but more importantly, gradually grow interests and confidence in programming as a form of interactive and creative practice.

My inspirations to design CodingCards come from James Gleick’s book *The Information: A History, a Theory, a Flood* and Seymour Papert’s book *Mindstorms*. Gleick traced back the origin of information as bits and I associated bits with Poker cards because each card has two sides. Therefore, a standard deck of cards can potentially be used to compute simple tasks. Papert’s view of physicality as an integral part of learning had influenced my choice of medium. Poker cards as physical objects are inherently fun, intuitive, and familiar to many students. Instead of grappling with abstract concepts, students can play the “codes” and externalize their thoughts to cards when they get stuck. Teachers can also restock the cards easily. To improve the design, I iterated CodingCards several rounds with a wide range of audiences (high school students from the technical schools and UWC Hong Kong, young professionals, and college students).

History Podcast

The History Podcast named “Human Biases Behind Algorithms” was created as the final project for my Global History class in 2017. In the Podcast, I creatively juxtaposed computerized algorithms with a British recipe called the Old Eel Pie in the 17th century, and Fordism, the management and production practices by the car company Ford, in the early 20th century. By creating this history podcast, I want to expand people’s conception of algorithms as more than just indifferent and external computer objects. My goal is to produce historically accurate stories that immerse people in the context of which these algorithms, or more broadly, procedures, were created and used, and reveal the continuity of human biases behind the algorithmic design.

I begin the process by defining the nature of algorithms as a cookbook that receives inputs, processes them, and then output results. Then I brainstormed two artifacts that people can easily relate to and usually will not think of as algorithms, which are recipes and the factories’ streamline production practices. After settling down the key comparisons, I searched for historical primary sources through which I can bring up the nuances and inspect the context. I believed podcast is the best medium for my goal as it uses accessible language and provides enough time to go in-depth with a few discussions. People can also listen closely to the historical sources I chose, a recipe and a letter, as I guided their attention throughout the Podcast. The structure of the narratives starts from a recent example showing how algorithms failed in the 2008 financial crisis to shatter the stereotypes on their mechanistic images. It flows from one source to another, connecting various perspectives across time to show people how algorithms were framed, interpreted, and used in different forms.

(Excerpted from John Murrell: A New Booke of Cookerie. London: London Cookerie, 1615.)

OLD EEL PIE

Englishman John Murrell published a cookbook in 1615 that included this recipe for eel pie. While we don’t know for sure that any colonists owned a copy of A New Booke for Cookerie, food historians believe that housewives and cooks might have used this type of recipe or “receipt.”

TO BAKE EELES.

Cut your Eeles about the length of your finger: season them with Pepper, Salt, and Ginger, and so put them into a Coffin, with a good piece of sweet Butter. Put into your Pye great Razins of the Sunne, and an Onyon minst small, and so close it and bake it.

“Coffin” simply means box here; it does not refer to a place for a corpse, so don’t worry. (Though in a sick sense, it is a coffin for the eels.) In the 1600s, a coffin was a deep pie shell, often made of whole-wheat flour pastry, which could be a little tough. The pastry would line a 3- or 4-inch deep pan that could be covered and set among the coals to bake. The coffin was more important for cooking than for eating, unless you were an Old World beggar. In that case, you were lucky to get the coffin crust.

Historical Source #1: Old Eel Pie recipe A Nevv Booke Of Cookeries (John Murrell, 1615)

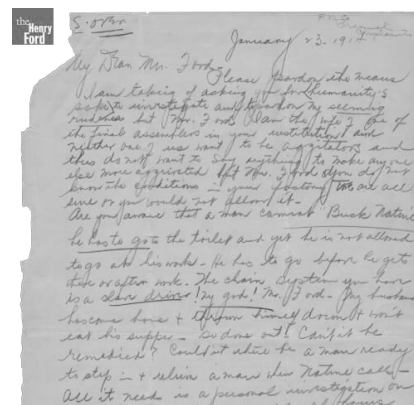

Jonathan: This sounds so.....old-fashioned! Who eats eels in pies today?

Xiaofan: Well, British people in 1600s did. This is a recipe taken from a cookbook published by John Murrell in 1615 England. West Europeans loved eel so much back then. England’s King Henry I even died from eating a “surfeit of lampreys”.⁴ Now think about the seasoning mentioned in the recipe. Pepper, Salt, and Ginger. At that time, Pepper can only be shipped from India and thus considered a luxury in Europe. It’s also the reason that Columbus sailed to the Americas because the turks blocked the spice trade routes. Ginger is another eastern spice that Britain mainly imported from China or India. From the way British designed this recipe, the ingredients they used, I can feel the elegance and proudness behind: it’s meant for the upper class British to demonstrate their power. However, when the British colonists brought this recipe to America, the usage scenario for the recipe changed. Imagined you were one of the English colonists in New England in the 17th century, an eel pie was most likely served on a spring dinner with some winter savory from the garden⁵.

Jonathan: why a spring dinner?

Xiaofan: Because back then, food availability was bounded by season! Eels usually swim toward the coast and enter the freshwater rivers in the spring from the cold Atlantic Ocean, which makes it perfect for harvest in Spring.⁶ British colonists were elated to discover the abundance of eels in New England area and eel pie soon become a family food, a classic dish on the colonists’ dinner table.⁷ Going through the steps of cooking an eel pie is less about elegance or proudness anymore, it’s a cultural lingering through which the New England immigrants can exercise their remaining British identities one more time. Interestingly, eel pie seems to lost its favor when America became independent because it people considered it as a colonial legacy, a symbol that is practiced by the “other.”⁸ However, what’s absence from this story is really how native Americans consume eels. All we have heard so far is the British

Community Network Project

I initiated the Community Network Project in 2017 to empirically study how my peers in the Minerva Class 2019 has been connected and disconnected over time. What triggered me to start such project are a few debates within my class cohort regarding whether forming small cliques should be allowed as people desire close friendships but also do not want to exacerbate the isolations. Some doubt that friend groups were already crystallized after the Sophomore year. Without empirical evidence, people often resorted to use moralizing language and subjective feelings as supports for their arguments.

To have a holistic and empirical view of our community friendship network, I collected self-reported friendship data for two years through survey and hashed the names to preserve anonymity. In total, 60% of the student body responded, and 95% of the population (out of 123 people) were identified. As a result, I created a report, in which I introduced the basics of graph reading, displayed the evolution of our community network, and analyzed it by various centrality metrics, regions of origins, and reasons to be friends. I gave a presentation of the report in the community and synthesized a few suggestions for both individuals and our community as a whole to encourage further integration.

I have found surprising insights that were used by both the student body and the staff in the following year for varying purposes, including evaluation of the state of mental health on a community level, and support for particular housing policies and student experience activities. Now two peers have joined me to extend this project as a longitudinal study. We have been collecting friendship data annually and are planning to expand the analysis and visualize it on the web before graduation.

Global Slum Immersion

Global Slum Immersion is a series of efforts to document, historicize, and compare slums (or places that used to be slums but were redeveloped) worldwide. As I study and live in San Francisco, Berlin, Buenos Aires, Seoul, Hong Kong, Shenzhen, and London with my school over the past four years, I have been taking notes on the under-resourced and redeveloped neighborhoods. My goal is to contextualize the local sites I visited within a broader social, political, and cultural history background and connected them a global discourse of slums. Furthermore, I would like to share my knowledge online so that more people get to know the stories beyond the stereotypes.

To achieve this goal, I usually start by choosing the most notorious slums (or sites used to be slums) in the cities that still located at the city centers today. Then I will visit the areas, take photos, walk around, and try to have a conversation with the local residents. By analyzing the field notes, photography, satellite images, and GoogleMaps, I was able to summarize the spatial syntax of the location and raise interesting questions that guide my research. As a result, my writings about the sites focus on how a social and spatial identity arise in these neighborhoods as a result of the interplay between the built environment and human agency. I also compared and contrasted these sites to distill the shared patterns of their formations and the peculiarities in each case. In addition to writing, I actively engage and publish my findings on public platforms (e.g., history pins, Wikipedia, and online exhibitions) so that the often neglected or biased history of these neighborhoods can be memorized and interpreted in a different light. A few of the examples are listed below.

The Social Space of Chinese Travelers x Airbnb

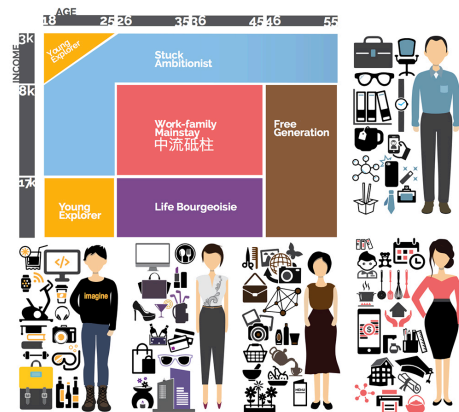

The Social Space of Chinese Travelers is a spatial representation along the axes of age and income to visualize different personas of Chinese travelers, created as part of the final report in a group project we submitted to Airbnb In 2015. I collaborated with two peers to derive categories of Chinese travelers through qualitative and quantitative methods, along with the branding strategies and marketing solutions that were most relevant to each type. As the primary user research person in the team, my task was to understand Chinese travelers -- who they are, what they like and how they travel—so that Airbnb can target them most effectively. Therefore, one of my design goals is to come up with a generative framework that synthesizes and classifies the behavioral and user preference data I collected through a survey.

I applied Bourdieu's theory of social space—a spatial construct of people's tastes along the axes of cultural and economic capital—to conceptualize the “social distance” of different user behaviors. Using multiple correspondence analysis on survey responses, I generated a social space image that showed the clustering of different traveling behaviors and derived five generic user categories of Chinese travelers -- young explorer, stuck ambitionist, work-family mainstay, free generation, and life bourgeoisie. Other qualitative methods, such as interviews, surveys, and participant observation, confirmed and complemented the interpretations of the classification. Different from Bourdieu, I picked age and income, instead of cultural and economic capital, as the driving factors that differentiate Chinese travelers, which is based on the information I gathered through interviews. In the end, I create a structured persona for each user type, which includes socio-economic background, life and travel mindset, and traveling behaviors and accommodation preferences.

Creating for Educators Toolkit x 1kg Box

Creating for Educators Toolkit is a pack of cards and templates that provide inspirations and process guidance for anyone who wishes to be an educator to create a thematic class. In 2014 summer, I created this toolkit with the founder of 1kg Box who owned a social enterprise that designs curriculum for rural teachers. We realized that the most valuable learning experience is fun, explorative, and most importantly, rooted in local context and connected to one's daily life. Therefore, we decided to create a toolkit that can empower everyone to design community-based learning experience without being trained as a teacher.

We followed a human-centered design process to identify problems, brainstorm ideas, prototype the toolkit with paper, and test it with volunteers. Instead of giving linear instructions, we designed the template in such that people will go through a series of questions to reflect and think in their context. The other medium is cards that people can experiment and recombine and feel ownership to what they designed. We also drew comics on the cards to make them more playful and intuitive. Besides joining the thinking process, I was responsible for collecting and transforming user feedback into iteration insights, curate a collection of activities, and designing the very templates that guide users through the thinking process of curriculum design.
